#### **Australian tourism**

- Quarterly data on visitor night from 1998:Q1 2013:Q4
- From: National Visitor Survey, based on annual interviews of 120,000 Australians aged 15+, collected by Tourism Research Australia.
- Split by 7 states, 27 zones and 76 regions (a geographical hierarchy)
- Also split by purpose of travel
  - Holiday
  - Visiting friends and relatives (VFR)
  - Business
  - Other
- 304 bottom-level series

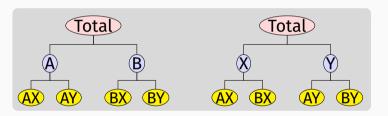

### **Grouped time series**

A **grouped time series** is a collection of time series that can be grouped together in a number of non-hierarchical ways.

### **Grouped time series**

A **grouped time series** is a collection of time series that can be grouped together in a number of non-hierarchical ways.

#### **Examples**

- Tourism by state and purpose of travel
- Retail sales by product groups/sub groups, and by countries/regions

```

# **Creating aggregates**

- Similar to summarise() but using the key structure
- A grouped structure is specified using grp1 \* grp2
- A nested structure is specified via parent / child.
- Groups and nesting can be mixed:

```
(country/region/city) * (brand/product)
```

- All possible aggregates are produced.
- These are useful when forecasting at different levels of aggregation.

### **Outline**

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 20

### The problem

- How to forecast time series at all nodes such that the forecasts add up in the same way as the original data?
- 2 Can we exploit relationships between the series to improve the forecasts?

## The problem

- How to forecast time series at all nodes such that the forecasts add up in the same way as the original data?
- 2 Can we exploit relationships between the series to improve the forecasts?

#### The solution

- Forecast all series at all levels of aggregation using an automatic forecasting algorithm.

  (e.g., ETS, ARIMA, ...)
- Reconcile the resulting forecasts so they add up correctly using least squares optimization (i.e., find closest reconciled forecasts to the original forecasts).
  - This is available using reconcile().

#### **Forecast reconciliation**

```
tourism |>
 aggregate key(Purpose * (State / Region), Trips = sum(Trips)) |>
 model(ets = ETS(Trips)) |>
  reconcile(ets_adjusted = min_trace(ets)) |>
 forecast(h = 2)
# A fable: 1,700 x 7 [10]
# Key: Purpose, State, Region, .model [850]
                                     .model Quarter Trips .mean
  Purpose State
                         Region

# Hierarchical and grouped time series

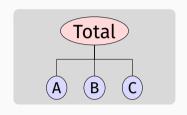

Every collection of time series with aggregation constraints can be written as

$$y_t = Sb_t$$

#### where

- $\mathbf{v}_t$  is a vector of all series at time t
- **m{b}\_t** is a vector of the most disaggregated series at time t
- **S** is a "summing matrix'' containing the aggregation constraints.

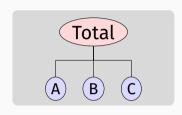

y<sub>t</sub>: observed aggregate of all series at time t.

 $y_{X,t}$ : observation on series X at time t.

b<sub>t</sub>: vector of all series at bottom level in time t.

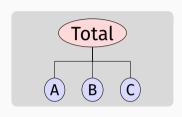

y<sub>t</sub>: observed aggregate of all series at time t.

 $y_{X,t}$ : observation on series X at time t.

**b**<sub>t</sub>: vector of all series at bottom level in time t.

$$\mathbf{y}_{t} = \begin{pmatrix} y_{t} \\ y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix}$$

y<sub>t</sub>: observed aggregate of all series at time t.

 $y_{X,t}$ : observation on series X at time t.

**b**<sub>t</sub>: vector of all series at bottom level in time t.

$$\mathbf{y}_{t} = \begin{pmatrix} y_{t} \\ y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix} = \underbrace{\begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}}_{\mathbf{S}} \underbrace{\begin{pmatrix} y_{A,t} \\ y_{B,t} \\ y_{C,t} \end{pmatrix}}_{\mathbf{b}_{t}}$$

Let  $\hat{\mathbf{y}}_n(h)$  be vector of initial h-step forecasts, made at time n, stacked in same order as  $\mathbf{y}_t$ .

Let  $\hat{\mathbf{y}}_n(h)$  be vector of initial h-step forecasts, made at time n, stacked in same order as  $\mathbf{y}_t$ . (In general, they will not "add up".)

Let  $\hat{\mathbf{y}}_n(h)$  be vector of initial h-step forecasts, made at time n, stacked in same order as  $\mathbf{y}_t$ . (In general, they will not "add up".)

Reconciled forecasts must be of the form:

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}\mathbf{G}\hat{\mathbf{y}}_n(h)$$

for some matrix G.

Let  $\hat{\mathbf{y}}_n(h)$  be vector of initial h-step forecasts, made at time n, stacked in same order as  $\mathbf{y}_t$ . (In general, they will not "add up".)

Reconciled forecasts must be of the form:

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}\mathbf{G}\hat{\mathbf{y}}_n(h)$$

for some matrix G.

■ **G** extracts and combines base forecasts  $\hat{\mathbf{y}}_n(h)$  to get bottom-level forecasts.

### **Optimal combination forecasts**

#### **Main result**

The best (minimum sum of variances) unbiased forecasts are obtained when  $\mathbf{G} = (\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}$ , where  $\Sigma_h$  is the h-step base forecast error covariance matrix.

### **Optimal combination forecasts**

#### **Main result**

The best (minimum sum of variances) unbiased forecasts are obtained when  $\mathbf{G} = (\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}$ , where  $\Sigma_h$  is the h-step base forecast error covariance matrix.

$$\tilde{\mathbf{y}}_n(h) = \mathbf{S}(\mathbf{S}'\Sigma_h^{-1}\mathbf{S})^{-1}\mathbf{S}'\Sigma_h^{-1}\hat{\mathbf{y}}_n(h)$$

**Problem:**  $\Sigma_h$  hard to estimate, especially for h > 1.

#### **Solutions:**

- Ignore  $\Sigma_h$  (OLS) [min\_trace(method='ols')]
- Assume  $\Sigma_h = k_h \Sigma_1$  is diagonal (WLS)

  [min\_trace(method='wls')]

#### **Features**

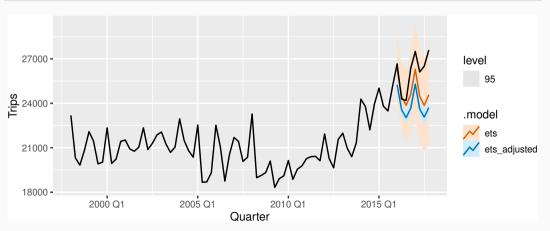

- Covariates can be included in initial forecasts.
- Adjustments can be made to initial forecasts at any level.
- Very simple and flexible method. Can work with any hierarchical or grouped time series.
- Conceptually easy to implement: regression of base forecasts on structure matrix.

#### **Outline**

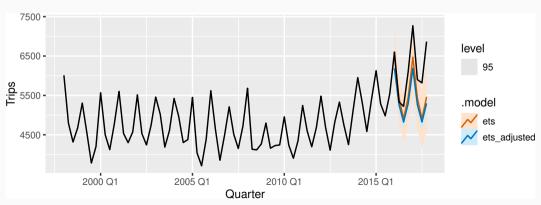

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 20

```
tourism_agg <- tourism |>
  aggregate_key(Purpose * (State / Region),
    Trips = sum(Trips)
)
fc <- tourism_agg |>
  filter_index(. ~ "2015 Q4") |>
  model(ets = ETS(Trips)) |>
  reconcile(ets_adjusted = min_trace(ets)) |>
  forecast(h = "2 years")
```

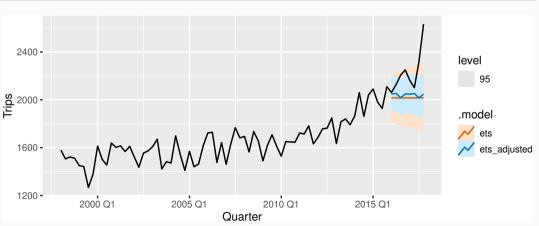

```
fc |>
  filter(is_aggregated(Purpose) & is_aggregated(State)) |>
  autoplot(tourism_agg, level = 95)
```

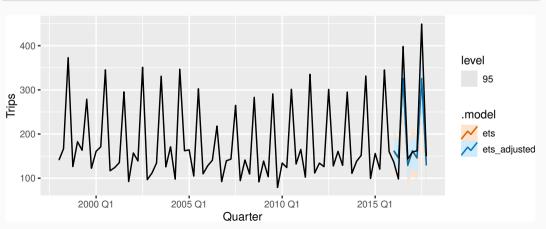

```

#### **Outline**

- 1 Hierarchical and grouped time series
- 2 Forecast reconciliation
- 3 Example: Australian tourism
- 4 Lab Session 20

#### Lab Session 20

- Prepare aggregations of the PBS data by Concession, Type, and ATC1.
- Use forecast reconciliation with the PBS data, using ETS, ARIMA and SNAIVE models, applied to all but the last 3 years of data.
- Which type of model works best?
- Does the reconciliation improve the forecast accuracy?
- Why doesn't the reconcililation make any difference to the SNAIVE forecasts?
